Art Unit: 2174

#### **DETAILED ACTION**

- 1. This communication is responsive to Amendment A, filed 1/26/04.
- 2. Claims 1-18 are pending in this application. Claims 1, 9, and 14 are independent claims. In the Amendment A, claims 17-20 were added, and claims 1-9, 11-12, 14 and 16-17 were amended. This action is made Final.
- 3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

# Claim Rejections - 35 USC § 103

4. Claims 1-4, 6, 9-12, and 14-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alexander et al. ("Alexander", US 6,038,516) in view of Lignoul (US 6,374,145 B1) and Saphir et al. ("Saphir", US 4,433,328).

As per claim 1, Alexander teaches a method of remotely monitoring electrical power in an electrical circuit comprising:

coupling a power meter to an electrical circuit for sensing power-related signals in said electrical circuit and generating power-related information based on said power related signals, and connecting a remote metering display to said power meter (fig 1; col. 15, lines 45 et seq.); said remote metering display including:

a display screen (fig. 1B; display screen of element 142), means for accessing said power-related information by navigating through menu options depicted on the display screen (abstract and figures 6A-6B).

Art Unit: 2174

Alexander does not explicitly disclose the navigating means to be a plurality of user interface buttons. However, Alexander's method provides scrolling operations for navigating through menu options (abstract). Official Notice is taken that the use of user interface buttons, such as keyboard navigating buttons or scroll bar buttons, to perform scrolling functions is well known in the art. It would have been obvious to an artisan at the time of the invention to include such buttons for use in conjunction with the scrolling functions of Alexander in order to facilitate user's menu navigation.

Alexander further does not teach a motion sensor for powering on the display screen in response to detection of a person's presence within a predetermined distance of the remote metering display. Lignoul teaches a proximity sensor for a user's presence in order to activate and deactivate a screen saver program on a display device (abstract, col. 3, lines 12 et seq.). It would have been obvious to an artisan at the time of the invention to combine Lignoul's teaching with Alexander's method in order to prolong the life of the display device as well as saving energy.

The method of Alexander and Lignoul does not teach the step of powering on the display device but rather activating. Saphir teaches a human motion sensing controller which powers on a device when it senses a person's presence within a zone of interest (abstract; col. 6, lines 49-68). It would have been obvious to an artisan at the time of the invention to combine Saphir's teaching with the method of Alexander and Lignoul in order to reduce unnecessary power consumption as well as prolong the monitor's life.

As per claim 2, the method of Alexander, Lignoul and Saphir does not expressly indicate the display screen to be a vacuum florescent display screen. However, Official Notice is taken

Art Unit: 2174

that the use of such a type of screen is well known in the art. It would have been obvious to an artisan at the time of the invention to use such a type of display screen with Alexander's system depending on implementation preference without compromising functionality.

As per claim 3, Lignoul teaches the display screen to be deactivated in response to no motion being detected by the motion sensor and none of the user interface buttons being pressed for a predefined period of idle time (col. 3, lines 12 et seq.) as well as the display screen to be powered off in Saphir (col. 7, lines 5-14).

As per claim 4, the method of Alexander, Lignoul and Saphir does not expressly teaches the predefined period of idle time to be definable in one of the menu options using the user interface buttons. However, Official Notice is taken that such a step of defining the predefined period of idle time through menu options, e.g. screen saver setting in Windows, is well known in the art. It would have been obvious to an artisan at the time of the invention to include such a setting feature with the method of Alexander, Lignoul and Saphir in order to provide a user with a quick and easy means for defining the predefined period of idle time.

As per claim 6, Lignoul teaches the motion sensor senses infrared waves to be projected from a person's body (col. 5, lines 8-16).

Claims 9-12 are similar in scope to claims 1-4 respectively, and are therefore rejected under similar rationale.

Claims 14-17 are similar in scope to claims 1-4 respectively, and are therefore rejected under similar rationale.

Art Unit: 2174

5. Claims 5, 7-8, 13 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Alexander et al. ("Alexander", US 6,038,516) in view of Lignoul (US 6,374,145 B1) and Saphir et al. ("Saphir", US 4,433,328) and further in view of Given et al. (US 6,560,711 B1).

As per claims 5 and 7-8, the method of Alexander, Lignoul and Saphir does not expressly teaches the motion sensor to include a plurality of selectable sensitivity levels for varying the predetermined distance, wherein the motion sensor to include a pyroelectric detector for sensing infrared waves projected from a person's body, and includes a fresnel lens for focalizing the infrared waves to a window area of the pyroelectric detector, wherein the pyroelectric detector generates an analog output signal, and wherein the motion sensor further includes an analog-todigital converter for receiving and digitizing the analog output signal. These features are what Given teaches in a method which utilizes a motion sensor that senses a user's presence in the vicinity (abstract; col. 7, lines 19 et seq.). It would have been obvious to an artisan at the time of the invention to include Given's features with the method of Alexander, Lignoul and Saphir in order to provide more flexibility to the functionality of the sensor of Alexander, Lignoul and Saphir. While Given does not specifically disclose an analog-to-digital converter for receiving and digitizing the analog output signal, however such a component would have been obvious to an artisan to be inclusive with Given's method so that the output signal could be digitized as required.

Claims 13 and 18 are individually similar in scope to claim 5, and are therefore rejected under similar rationale.

### Response to Arguments

6. Applicant's arguments with respect to claims 1-18 have been considered but are either moot in view of new ground(s) of rejection or not persuasive.

- Applicant argues the followings: (a) Alexander does not disclose a "motion sensor"; (b) there is no motivation in Alexander to include the user interface buttons as required by Applicants' amended claims; (c) Lignoul does not teach the step of detecting a person's presence within a "predetermined distance" of the display, but rather only detects a user "in the vicinity" of the display; (d) the use of a VFD screen would not have been an obvious choice to an artisan with Alexander's teaching, and (e) Given does not teach the requirement of capturing voltage sense levels received from the motion sensor of Given.
- 8. Per (a), the Examiner acknowledges an oversight in citing Alexander instead of Lignoul regarding to Applicant's argument associated with claim 6. The Examiner disagrees for the following reasons.
- 9. Per (b)-(e), the Examiner disagrees for the following reasons.

Per (b), the claim language of claim 1 requires "a plurality of user interface buttons for navigating through menu options". Alexander teaches scrolling operations for navigating through menu options (Abstract, lines 8-11), as well as the use of a keyboard 144 in fig. 1b. It would have clearly obvious that keys such as Up/Down Arrows could be used to help users move/scroll from one menu option to another. Such operations would clearly read into the claim limitation as recited.

Per (c), while Lignoul's teaching does not explicitly disclose the detecting to take place within a "predetermined distance", Lignoul's proximity sensor detects the presence of an user "in

Art Unit: 2174

the vicinity". It is noted that any sensor that is designed to detect movement within a certain proximity must necessarily be adjusted for a certain (predetermined) distance for detection either at the manufacturing plant or by the user in order to monitor a specific sphere of coverage.

Per (d), as pointed out in the previous Office Action, the use of VFD is well known in the art, and it would have been obvious to an artisan at the time of the invention to use such a type of display screen with Alexander's system depending on implementation preference without compromising functionality. An example of a typical display device for presenting menus or other display contents to users, where any type of display technology, including VFD, could be employed depending on implementation preference (Long, US 6,695,166 B2; col. 3, lines 50 et seq.).

Per (e), it is requested for Applicant's attention to be directed to col. 7, lines 47-50 of Givens, where the sensitivity level could be adjusted.

#### Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37

Art Unit: 2174

Page 8

CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

## *Inquires*

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Sy Luu whose telephone number is (703) 305-0409. The examiner can normally be reached on Monday - Thursday from 7:00 am to 4:30 pm (EST). The examiner can also be reached on alternate Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kristine Kincaid, can be reached on (703) 308-0640.

The fax number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 305-3900.
